

Why solar, from Mole Energy, is worth the wait

David Stevenson, Mole Energy

Solar panels and batteries are the cost-effective way to cut your energy bills, protect yourself from price hikes and cut your carbon footprint.

As the energy crisis continues, demand for solar and battery storage grows, with our team responding to as many requests as possible; while still ensuring the delivery of high quality installations. In the last nine months we've expanded our team, to handle three times as many enquiries, increasing our installation rate by 300%.

Today, our lead time for installations can be up to eight months - a number which we're working hard to reduce. So why do our customers still think it's worth the wait?

The long game

Solar panel and battery storage installations are long term investments with the power to cut our customers' energy bills for decades. That makes waiting a few months for a high-quality installation, with long-term after-sales support, an easy decision.

But there's more to it. Our customers know they could go elsewhere for their new panels and batteries, but they choose to wait for Mole Energy. The reason? Trust.

At Mole Energy, we've been installing solar across the South West since 2010. In that time we've seen periods of boom and bust, when scores of suppliers entered the market and then wound up their businesses, leaving their customers' systems unsupported. We've stayed the course, building on our expertise and forging strong supplier relationships - and that makes all the difference.

Supply chain security - why customers are happy to wait

Mole Valley Farmers has been serving the agricultural community for over 60 years; so our customers can relax in the knowledge that we're here for the long term and will deliver on our promises.

Taking stock:

Securing stock is one of the biggest challenges solar installers face today. Our long established relationships with suppliers; going back

to 2010 and backed by Mole Valley Farmers, enables us to commit to buying more stock, on behalf of our customers - helping to protect them from supply chain problems.

Our customers are happy to wait for us to deliver their system - why? Because they have confidence we'll have the right kit in place, at the start of their project; ready to honour the delivery date we give them. We can even deliver panels to our commercial customers before installation, for maximum peace of mind.

Smooth the way

When you're ready to enquire about solar and battery storage, it would be handy to have your annual energy bill easily available, including unit price and kilowatt hours, (kWhs). This information will help us to understand your home and business energy habits and determine whether we think solar panels and/or battery storage are viable for you. And with energy prices so unpredictable, you might find this useful to understand too.

You'll find additional information on our website including products, prices and the areas covered by our solar and battery storage installation services.

Our team looks forward to hearing from you. And I promise; your solar will be worth the wait.

"We had our solar system installed in March this year and would advise anyone thinking of getting panels now to invest in a battery as well. Although an added expense, we are reaping the benefit of having stored electricity available to use overnight. **We have hardly used energy from the grid since installation and so the outlay has been worth it.**

We have the inverter and battery located in our garage and the installers from Mole Energy did a very neat job with minimal disruption to us. We had to wait quite a while for our installation date, as they were very busy. **We would highly recommend this company."**
