

Solar PV Ground Mounts

AWARD
WINNING
SOLAR
INSTALLATIONS

Self-power your home and business.
Reduce energy bills and CO₂ emissions.

"Our ground mount was very simple to install and we were very pleased with the service provided.

We've paid off our investment and the ground mount is still firmly in place after eight years. Today, **it generates enough solar power to cover 20% of our overall annual energy costs.**

We're very happy with this return on investment and are looking to install more panels in the future."

Part of

Mole Energy - Agricultural Specialists

The team at Mole Energy will manage your ground-mounted solar project from start to finish, looking after every detail to ensure a high-quality installation that's optimised for years of operation:

We'll design your bespoke system, taking into consideration your requirements, site orientation, shade and space, for maximum performance.

We'll work with your local District Network Operator (DNO) to gain approval for your system capacity, and to connect the system to the Grid.

We'll introduce you to architects who specialise in ground mounts and will produce technical, scaled drawings and planning applications; working with the planning office, on your behalf.

We'll determine your ideal cable size, taking into consideration your solar output and distance to a connection point - and connect your cables from the ground mount to the power supply. In some cases, we'll arrange for your DNO to install a new connection point that's closer to the array.

We'll work with groundwork contractors who understand the specialist requirements for digging cable trenches and preparing ground works for solar frames.

We'll install your system and provide a full handover.

We're here to support you in developing and maintaining your low carbon future.
